

SAVEIQ – AI SAVINGS GOAL TRACKER

1. Introduction

Managing money becomes more difficult when a person has several financial goals at the same time. A user may want to save for a laptop, vacation, emergency fund, study table, or vehicle, while also trying to understand how much has already been saved and whether the target can be reached on time. SavelQ – AI Savings Goal Tracker was developed as a simple web-based solution for this problem.

SavelQ brings savings goals, progress tracking, deadlines, notifications, and AI-based financial guidance into one application. The project focuses on making goal-based saving easier to understand and more consistent without requiring users to perform repeated manual calculations.

2. Project Description

SavelQ is an AI-powered personal finance management system that allows users to create and monitor multiple savings goals. A goal can include its name, target amount, initial savings, deadline, category or purpose, and a motivation note. The application calculates and displays the amount saved, remaining amount, progress percentage, and goal status.

The system also includes an AI Financial Advice section that uses relevant goal information such as progress, target amounts, and deadlines to provide personalized guidance. Notifications help users stay aware of overdue goals and important deadlines.

3. Problem Statement

Saving money is not always the difficult part—knowing how much to save, for what goal, and whether we are still on track is. People often manage multiple financial goals manually. When savings change, a contribution is missed, or a deadline approaches, they may need to recalculate their plans.

This makes goal-based saving confusing, time-consuming, and difficult to maintain consistently. There is a need for a simple system that can track multiple goals and dynamically guide users according to their current savings situation.

4. Proposed Solution

SavelQ provides a centralized savings-goal tracker where users can create multiple goals and monitor them from a single dashboard. The application presents progress and remaining amounts, identifies goal status, and provides AI-based guidance.

- Create and manage multiple savings goals.
- Track target amount, saved amount, remaining amount, progress, and deadlines.
- Identify active, completed, and overdue goals.
- Provide AI-based financial recommendations.
- Provide simple saving guidance through the 50-30-20 Savings Allocator and beginner saving rules.
- Keep users informed through notifications.

5. Objectives

- Make goal-based savings easier to organize and understand.
- Reduce repeated manual calculations for different savings goals.
- Give users a clear visual view of their financial progress.
- Use AI to provide personalized financial guidance.
- Help users stay aware of deadlines and overdue goals.
- Demonstrate the practical use of AI-assisted web development.

6. Main Features

Feature	Description
Dashboard	Shows total goals, active goals, completed goals, overdue goals, and overall savings progress, along with visual information.
Create Savings Goal	Allows the user to enter goal name, target amount, initial savings, deadline, category, and motivation.
My Goals	Displays individual goals with target, saved, remaining, progress, deadline, and status. Users can update goals and add savings.
AI Financial Advice	Provides financial insights, an AI financial coach, a 50-30-20 Savings Allocator, and simple saving rules.
Notifications	Keeps the user informed about important goal-related events such as overdue goals and approaching deadlines.

7. Example Use Case

Consider a user who wants to save for a car. The user creates a goal named 'Car', enters a target amount such as ₹8,00,000, adds current savings, selects a deadline and category, and creates the goal. SavelQ then adds the goal to the user's goals and calculates its progress. As the user adds savings, the saved amount, remaining amount, and progress percentage are updated. The user can also open AI Financial Advice to ask for guidance related to saving faster or prioritizing goals.

8. Technical Architecture

The system is organized into a web interface, application logic, data and automation services, and an AI layer. The user interacts with the SavelQ interface, while the application processes goal and savings information. Google Sheets and Google Apps Script support data handling and automation, and Groq AI is used for AI-based financial guidance.

1. User → interacts with the SavelQ web interface.
2. Web interface → collects goal information and user actions.
3. Application logic → processes savings, progress, status, and page interactions.
4. Google Sheets / Google Apps Script → supports data storage, handling, and automation.

5. Groq AI → analyzes relevant financial-goal information and generates guidance.
6. SavelQ interface → displays updated information, recommendations, and notifications.

9. Technology Stack

Technology	Role
HTML	Provides the structure of the web pages.
CSS	Provides layout, styling, spacing, and visual design.
JavaScript	Handles application logic, interactions, calculations, and dynamic updates.
Google Sheets	Supports storage of relevant project data.
Google Apps Script	Supports data handling and automation.
Groq AI	Provides AI-based financial recommendations and conversational guidance.
Google Antigravity	Used as an AI-assisted development environment for building and refining the application.

10. Prerequisites

- Laptop or desktop computer.
- Modern web browser.
- Internet connection.
- Google account for Google Sheets and Google Apps Script.
- Groq API access for AI functionality.
- Google Antigravity for AI-assisted development.
- Basic understanding of HTML, CSS, JavaScript, and web applications.

11. Project Workflow

The overall workflow of SavelQ is: User Input → Goal Creation → Data Processing → Progress Tracking → AI Analysis → Recommendations / Notifications → User Action.

7. The user creates a savings goal by entering the required details.
8. The application stores and displays the goal.
9. The user can add savings as progress is made.
10. The system updates the saved amount, remaining amount, and progress.
11. Goal deadlines and statuses are monitored.
12. Relevant information is used by the AI advice module.
13. The user receives recommendations and notifications and can take further action.

12. Development Approach

The project was developed using Google Antigravity as an AI-assisted development environment. Prompts were used to describe required features and interface changes. The implementation was then reviewed, tested, and refined according to the project requirements.

14. Define the required feature or page.
15. Describe the requirement through an appropriate development prompt.
16. Review the generated code and interface.
17. Run and test the application.
18. Identify issues and refine the implementation.
19. Verify the final behavior before demonstration.

13. Project Milestones

Milestone 1 – Model Selection & Architecture

Study the problem and requirements, select Groq AI for the AI component, decide the technical stack, and define the overall system architecture.

Milestone 2 – Core Functionality Development

Implement goal creation, target and initial savings, savings updates, progress calculations, deadlines, and goal status.

Milestone 3 – Application Development

Integrate the main functions into the SaveIQ application and build the dashboard, My Goals, AI Financial Advice, and notification functionality.

Milestone 4 – Front-End Development

Develop and refine the interface using HTML, CSS, and JavaScript, including navigation, forms, cards, progress indicators, and page layouts.

Milestone 5 – Deployment

Test the application, resolve implementation issues, run the project successfully, and publish it for demonstration.

Milestone 6 – Web Pages, Testing & Finalization

Complete and verify the main web pages, perform final testing, prepare documentation, and finalize the project demonstration.

14. Web Pages

Dashboard: Shows total goals, active goals, completed goals, overdue goals, and overall savings progress, along with visual information.

Create Savings Goal: Allows the user to enter goal name, target amount, initial savings, deadline, category, and motivation.

My Goals: Displays individual goals with target, saved, remaining, progress, deadline, and status. Users can update goals and add savings.

AI Financial Advice: Provides financial insights, an AI financial coach, a 50-30-20 Savings Allocator, and simple saving rules.

Notifications: Keeps the user informed about important goal-related events such as overdue goals and approaching deadlines.

15. Testing and Validation

- Verified creation of savings goals with required details.
- Verified savings updates and progress calculations.
- Checked active, completed, and overdue goal states.
- Tested navigation between major pages.
- Checked dashboard statistics and visual progress.
- Tested the AI Financial Advice interface.
- Checked notification-related information.
- Performed final browser testing before demonstration.

16. Expected Benefits

- Centralized management of multiple savings goals.
- Clear visual understanding of progress.
- Less manual calculation and tracking.
- Personalized AI-based financial guidance.
- Better awareness of deadlines and overdue goals.
- Simple saving guidance for beginners.

17. Future Scope

The current project focuses on goal tracking and financial guidance. Future versions could extend the system with secure integration with real financial accounts, more advanced analytics, richer notification options, mobile support, and additional financial planning tools. Such extensions would require appropriate security, privacy, and integration considerations.

18. Conclusion

SaveIQ – AI Savings Goal Tracker provides a simple and centralized way to manage multiple savings goals. It combines goal creation, progress monitoring, deadline awareness, notifications, and AI-based financial guidance in a single web application.

The project demonstrates how HTML, CSS, JavaScript, Google Sheets, Google Apps Script, and Groq AI can be combined with an AI-assisted development approach to build a practical digital finance solution. Overall, SaveIQ aims to help users understand their savings situation, stay consistent with their goals, and make better-informed saving decisions.
